In vitro activity of omadacycline against infrequently encountered pathogens

Objective

Determine the *in vitro* activity of omadacycline and comparators against infrequently encountered Gram-positive, Gram-negative, and anaerobic bacterial pathogens from the SENTRY Surveillance Programme.

Conclusions

- Omadacycline demonstrated potent *in vitro* activity against infrequently encountered Gram-positive, Gram-negative, and anaerobic bacterial clinical isolates, including strains demonstrating resistance to other drug classes.
- Many bacteria had MIC₉₀ deemed susceptible to omadacycline when applying established breakpoints for a similar genus or organism group.
